[Hiring Manager Name/Recruitment Team]

[Company Name]

[Company Address/Location]

Dear [Hiring Manager Name/Recruitment Team] ,

I am writing to apply for the [Role Title] position at [Company Name] . As an Electronic Engineering and Computer Science student at Aston University (Predicted First Class) and Top 40 Finalist in the Black Heritage Undergraduate of the Year Award 2026, I have spent the past two years building and shipping production-quality software across the full stack: from Next.js server components and PostgreSQL to Cloudflare Workers at the edge and Python automation pipelines.

My most substantial project is my personal portfolio dashboard, a Next.js 16 App Router application backed by Supabase PostgreSQL, Upstash Redis and Cloudflare Workers, integrating more than 30 live data sources: PS5 and Discord real-time presence, Spotify now-playing, WakaTime coding heatmaps, blog scroll-depth analytics and automated CV generation via GitHub Actions. Every part of that system is in production and maintained by me alone, which means I have navigated every layer of the stack: schema migrations, rate limiting, auth flows, CI/CD and edge caching. Alongside this I built AstonCV, a PHP 8.2 full-stack CV database deployed live on Aston University servers, implementing 12+ security controls including JWT authentication, RBAC, CSRF protection, brute-force lockout and bcrypt hashing from scratch. I am particularly drawn to [Company Name] because of [specific reason] and I am eager to contribute to [specific area or project] .

What distinguishes my work is an end-to-end mindset backed by CI/CD discipline. I run GitHub Actions pipelines for automated PDF and DOCX CV regeneration, WakaTime syncs and secret scanning on every push. My open source git-unlocked course (217 topics, MIT-licensed, CI-validated) and dotfiles project (59 numbered topics, 3-platform git mirroring) reflect a habit of documenting systems thoroughly and building them to survive being handed off. I also have hardware depth that most software candidates lack: I have designed custom PCBs, written bare-metal ATmega644P C with hardware interrupts and PWM, and built an IoT predictive maintenance platform (PHAEMOS) with ESP32/STM32 nodes, a FastAPI backend and an Isolation Forest anomaly detection model, all of which trained me to think about systems rather than features.

I am looking for a team that ships real products and cares about code quality. [Company Name] 's focus on [specific aspect of company culture, product or engineering practice] aligns closely with the way I already work, and I would relish the chance to iterate fast on problems that matter to users rather than only academic exercises. I am comfortable picking up unfamiliar codebases, unblocking myself with documentation and asking precise questions when I genuinely need context.

Thank you for considering my application. I would welcome a conversation about how I can contribute to [Company Name] 's engineering team.

Yours sincerely,

Isaac Adjei
